

### Sure Edge® Check Kerb Trim

The Sure Edge, Check Kerb Edge increases the installation ease, speed and improves the appearance of your roof edge.

This trim features a compression seal along the underside to create a water tight seal to the roofing membrane. This trim eliminates the need of creating a timber upstand as a water check at the roof perimeter.

Manufactured from co-extruded u-PVC creating a solid foam construction with hard wearing, durable properties. This is the same technology as used in u-PVC fascia manufacture.

### Intended Uses

For creating a water check to flat & low sloping roofs with RubberBond membrane.

### Features and Benefits

- Creates a 20mm upstand at the roof edge
- Smooth, hi-gloss finish – easy to keep clean & great looking
- 10mm x 15mm sealing compression foam, factory fitted to the underside of the trim to create a water tight seal to the membrane, over seams and detailing joints.
- Pre drilled fixing holes, for accurate & fast installation
- Complete range of colour matched joints and corner accessories

### Installation

1. Before installation of the membrane ensure a solid fixing can be achieved at the perimeter of the roof. A timber fixer can be installed if required.
2. Install the membrane to the roof surface as per manufacturers' specifications.

## Installation cont.

3. Ensure the membrane extends down the vertical edge of the roof by a minimum of 50mm
4. Position the edge trim onto the roof surface so the sealant foam is compressed by 30% and the face of the trim is in a vertical position.
5. Using the 50mm PolyTop nails fix the edge trim into position. A fixing must be in each predrilled hole to achieve correct installation.
6. Position the next length of front plate leaving a 1mm expansion gap for each metre of trim used. Ensure that each trim has foam seal extending up the end to create a seal between trim lengths.
7. Fit the cover clips at each joint between lengths of trim
8. Install corners or stop ends where needed.
